Muswellbrook Coal Company PO Box 123 Muswellbrook NSW 2333

RE: AUGUST 2023 NOISE MONITORING RESULTS – MUSWELLBROOK COAL MINE

This letter report presents the results of noise compliance monitoring, commencing at about 10.00 pm on Tuesday 15th of August, 2023, for the Muswellbrook Coal Company (MCC) mine at Muscle Creek Road, Muswellbrook. The monitoring was undertaken as per the requirements of D.A. 205/2002 and detailed in the Noise Management Plan (NMP) for the mine.

Attended Noise Monitoring Program

Noise monitoring was undertaken in accordance with the NMP as summarised below.

All attended monitoring and equipment maintenance and calibration is conducted in accordance with the Noise Policy for Industry (NPfI) and AS1055 – Acoustics, Description and Measurement of Environmental Noise.

Attended noise monitoring is undertaken monthly by an independent noise consultant. Each attended noise survey will be conducted during night periods only. If it is identified during the noise monitoring that the mining noise from the operation is exceeding the criteria, MCC will be notified and the operations will be modified as required. Monitoring at the location(s) where the noise levels are elevated will be undertaken again with a minimum break of 75 minutes between monitoring.

The noise criteria for MCC apply under all meteorological conditions except for the following:

- i. Wind speeds greater than 3m/s at 10m above ground level; or
- ii. Stability category F temperature inversion conditions and wind speeds greater than 2 m/s at 10m above ground level; or
- iii. Stability category G temperature inversion conditions.

To determine compliance with the Leq (15 min) operational noise criteria the modification factors detailed in Section 4 of the NPI must be applied, as appropriate, to the measured noise levels.

Due to the distance of the mine from each residence, the monitoring of LA1 (1minute) at the facade is not considered necessary and will be conducted at/or near the property boundary.

The attended noise monitoring locations are detailed in **Table 1** and shown in **Figure 1**.

| Nois | Table 1 se Monitoring Locations | | | | | |

| Location Description | | | | | | |
| R13 | Sandy Creek Road | | | | | |
| R15 | Queen St | | | | | |
| R17 | Queen St | | | | | |
| R25 Sandy Creek Road | | | | | | |
| R32 Muscle Creek Road | | | | | | |

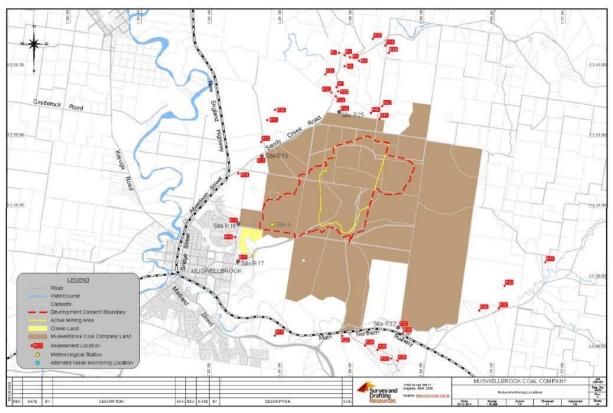

Figure 1 – Noise Monitoring Locations

Noise criteria for all assessment locations shown in Figure 1 are detailed in Appendix I to this report.

Monitoring Equipment

Attended noise monitoring was conducted with a Brüel & Kjær Type 2250 Precision Sound Analyser. This instrument has Type 1 characteristics as defined in AS1259-1990 "Sound Level Meters" and has current NATA calibration. Field calibration is carried out at the start and end of each monitoring period. Calibration certificates are attached as **Appendix II** to this report.

A-weighted noise levels were measured over the 15 minute monitoring period with data acquired of 1 second statistical intervals and the meter set to "fast" response. Each 1 second measurement is accompanied by a third-octave band spectrum from 20 - 20k Hz which is required for analysing NPI 'modifying factors'.

Time based field notes allow for determination of the relative contributions to the overall noise level of all significant noise sources.

Measurement Analysis

The MCC compliance noise criteria are based on a 15 minute Leq noise level. The 15 minute Leq noise level for each monitoring period is shown in the tables below. Where the noise from MCC was audible Bruel & Kjaer "*Evaluator*" analysis software was used to quantify the contribution of the mine and other significant noise sources to the overall level. Mine noise from MCC is shown in the table in bold type.

All noise levels shown are in dB(A) Leq (15 min) unless otherwise detailed.

MCC Operations

Operational details for MCC for the monitoring period on 15th of August, 2023 are detailed in **Appendix III**. At the time of the noise monitoring MCC had ceased mining operations and work was being undertaken to rehabilitate the site.

Noise Compliance Assessment

The results of the noise measurements are shown in **Table 2**.

| | | | MCC Op | erational No | | ole 2 pring Result | s – 15 Augus | it 2022 | |
|----------------------------|-------------|---------------|-----------------------------------|---------------------------|-------------------------------------|--------------------------------------------------|----------------------------------------------------------------|---------------------------------|--------------------------------------------|
| Location | Time | dB(A), Leq | MCC Contribution dB(A), Leq | Criterion dB(A) Leq | dB(A), L1 (1min) ¹ | Criterion dB(A), L1 (1min) ¹ | Stability Class/ Wind speed (m/s)/dir ^o | Compliant Met Conditions? | Identified Noise Sources ² |
| R13 Sandy Creek Rd. | 10:18 pm | 42 | 40 | 41 | 45 | 45 | E/2.2/188 | Yes | MCC (40), train (37), traffic (30) |
| R15 Queen St. | 10:41 pm | 39 | 36 | 37 | 44 | 45 | E/2.2/114 | Yes | MCC (36) , traffic (35), frogs (31) |
| R17 Queen St. | 11:00 pm | 37 | n/a | 35 | n/a | 45 | D/2.1/143 | Yes | Traffic (36), frogs (31), MCC inaudible |

| R32 Muscle Creek Rd. | 11:24 pm | 34 | n/a | 35 | n/a | 45 | D/2.5/147 | Yes | Frogs (34), MCC inaudible |

1. L1 (1 min) from MCC mine noise only

2. See text regarding MCC noise sources

The results in Table 2 show that, under the operational and meteorological conditions at the time, noise from MCC was only audible and measurable at monitoring locations R13, R15 and R25. At each of these locations the noise from MCC was from a combination of engine revs, dozer tracks, dumping

noise and mine hum. Modulated frequency reverse alarms were also occasionally audible. The noise from MCC was not audible at the other two monitoring locations.

The data analysis presented in Table 2 shows that the noise from MCC did not exceed the relevant noise criteria at any time or location during the monitoring period.

The data from the mine operated weather station showed that meteorological conditions were compliant with the conditions in the NMP for the entire noise monitoring survey.

As indicated above, noise from MCC was measured at monitoring Locations R13, R15 and R25.

Data from those times where MCC operations were audible during the monitoring survey were analysed using the *"Evaluator"* software. This analysis showed the noise did not contain any tonal or impulsive components as per definitions in the NPI.

The methodology for analysing the low frequency noise modifying factor correction in the NPI is shown in extract below.

| Low-frequency noise | Measurement of source contribution C- weighted and A- weighted level and one-third octave measurements in the range 10– 160 Hz | Measure/assess source contribution C- and A-weighted Leq,T levels over same time period. Correction to be applied where the C minus A level is 15 dB or more and: where any of the one-third octave noise levels in Table C2 are exceeded by up to and including 5 dB and cannot be mitigated, a 2- dB(A) positive adjustment to measured/predicted A- weighted levels applies for the evening/night period where any of the one-third octave noise levels in Table C2 are exceeded by more than 5 dB and cannot be mitigated, a 5- dB(A) positive adjustment to measured/predicted A- weighted levels applies for the evening/night period and a 2- dB(A) positive adjustment applies for the daytime period. | 2 or 5 dB ² | A difference of 15 dB or more between C- and A-weighted measurements identifies the potential for an unbalance spectrum and potential increased annoyance. The values in Table C2 are derived from Moorhouse (2011) for DEFRA fluctuating low- frequency noise criteria with corrections to reflect external assessment locations. |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Table C2 : One-third octave low-frequency noise thresholds.

| Hz/dB(Z) | One-th | One-third octave dB(Z) Leq (15 min) threshold level | | | | | | | | | | | |
|----------------|--------|-----------------------------------------------------|----|----|----|------|----|----|----|----|-----|-----|-----|
| Frequency (Hz) | 10 | 12.5 | 16 | 20 | 25 | 31.5 | 40 | 50 | 63 | 80 | 100 | 125 | 160 |
| dB(Z) | 92 | 89 | 86 | 77 | 69 | 61 | 54 | 50 | 50 | 48 | 48 | 46 | 44 |

The correction applies to the mine noise component only. There are many sources of low frequency noise in the acoustic environment of each receiver area (including noise from road and rail traffic and

from rail track works). In many cases the C minus A level is greater than 15dB due to these other noise sources. In most instances the screening criteria will be the one third octave analysis. Should the mine noise not comply with this then the C minus A analysis will be applied.

Tables 3, **4** and **5** show the low frequency noise analysis for the periods where the mine noise was able to be accurately isolated from the overall measurement during the monitoring at Locations R13, R15 and R17 respectively.

The results in Tables 3, 4 and 5 show that there is no requirement to apply a low frequency noise modifying factor correction to the measured noise levels at Locations R13, R15 and R25.

In addition to the operational noise, the noise from MCC must not exceed **45 or 47 dB(A) L1 (1 min)** between the hours of 10 pm and 7 am (see Appendix I for details of noise criteria at various receiver locations). This is to minimise the potential for sleep disturbance as a result of individual loud noises from the mine.

The compliance measurement locations are different for each of the operational and sleep disturbance noise. That is, the sleep disturbance criterion is typically applicable at 1m from the facade of a bedroom window.

To avoid undue disturbance to residents the L1 (1 min) noise level from the operational measurements are used to show general compliance with the sleep disturbance criterion. That is, as the distance between the noise source and the operational noise monitoring location is significantly greater than the distance between the operational noise monitoring location and the sleep disturbance monitoring

location (i.e. 1m from the facade of the house) there will be little variation in L1 (1 min) levels between the two monitoring locations.

It must be noted, however, that the sleep disturbance criterion is applicable at the outside of a bedroom window. As the internal layout of each residence is not known, to consider a worst case, the bedroom windows were assumed to be facing towards the mine.

As shown in Table 2, during the night time measurement circuit the L1 (1 min) noise from MCC was did not exceed 45 dB(A) at any monitoring location.

We trust this report fulfils your requirements at this time, however, should you require additional information or assistance please contact the undersigned on 0412 023 455.

Yours faithfully,

SPECTRUM ACOUSTICS PTY LIMITED
